

ABSTRACT

The invention relates to a spinning device for the manufacture of a spun thread from a fibre bundle, surrounding a nozzle block with one or more nozzles, which take effect on a fibre bundle which is conveyed against a spindle. The rear fibre ends are taken up and rotated in the direction of rotation of the air flow in such a way that they rotate the front ends of the fibres which are already located in the yarn guide channel to form a yarn. Channels having different conveying lengths conduct the fibers to the spindle.
